⚡ EZA DISTROAPP

Music distribution platform — founded by artist HB pEza

A complete full-stack music distributor: real backend server, database, artist accounts, upload pipeline, distribution tracking, royalties with plan-based commission, revenue splits, payouts, and a full admin control panel for you.

▶️ How to run

```
cd ezadistroapp
node server.js
```

Then open **http://localhost:3000** in your browser. That's it — zero npm installs needed.

🔑 Your Admin account (only for you)

Email	`hbpeza@gmail.com`
Password	`HBpeza@2026` (change it via env: `ADMIN_PASSWORD=YourPass node server.js`)

When you log in as admin you get the 🛡️ **Admin Panel**: view every signed-up artist, every release, approve releases (goes live instantly), reject, or takedown — plus platform stats including your 15% commission earnings from Free-plan artists.

👥 For your clients/artists

They sign up themselves, pick a plan, upload releases (artwork + multi-track audio), watch distribution go live across 10 stores, track earnings, set collaborator splits, and add payout details.

💰 The two plans ("before uploading / after selling")

Plan	Upfront	Commission
FREE PLAN	$0	EZA keeps **15%** of earnings
EZA PRO	$19.99/yr	**0%** —artist keeps 100%

Artists choose the plan **before uploading**; commission applies automatically **after they sell**.

🏗️ What's inside

- `server.js` — zero-dependency Node.js backend: auth (scrypt-hashed passwords, signed session tokens), releases API, audio/artwork storage, distribution state engine, royalty simulator, admin decision endpoints, JSON database in `data/db.json`.
- `public/index.html` — the full app: landing page, auth, 5-step upload wizard with real file uploads, per-store live tracking, charts, splits, payouts, settings, admin panel.

🔌 Going to real stores (the honest next step)

This platform's upload/review/live pipeline mirrors how real distribution works. To push releases into Spotify/Apple for real you need a distribution partner with existing DSP deals: **FUGA**, **The Orchard**, **Symphonic**, **Vydia**, or **Songtradr**. Their APIs replace the simulated delivery step — your admin approval pipeline stays exactly the same, and royalties arrive as real DDEX reports instead of estimates.

Demo streams/earnings are simulated deterministically per release so you can demo the full money flow today.
